## ***DETAILED ACTION***

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 04/29/2005 has been entered. Claims 1 and 13 are pending and found allowable.

### ***REASONS FOR ALLOWANCE***

2. The following is an examiner's statement of reasons for allowance:

- As the closest reference, Heim et al (US 5,793,578) discloses a thin film magnetic head comprising a lower core layer, a bottom pole layer formed on the lower core layer, a nonmagnetic gap layer formed on the bottom pole layer, an upper core layer to be joined to the top of the gap layer at a surface facing a recording medium, and a coil layer formed behind the bottom pole layer in the height direction, wherein the upper core layer comprises a tip region and a rear end region, the tip region being exposed with a track width at the surface facing the recording medium, the rear end region extending backward from the end edge of the tip region in the height direction so that the width dimension in the track width direction gradually increases in the height direction, wherein the space between the tip region of the upper core layer and the bottom pole layer comprises a first portion extending backward from the surface facing the recording medium in the height direction, in which only a gap layer is present, and a gap depth is regulated by the end edge of the portion, and a second

portion extending backward from the end edge of the first portion in the height direction, **but fails to show** that in the second portion a partial insulating layer is formed on the gap layer and on a first insulating layer, and in which the partial insulating layer is present together with the gap layer or with the gap layer removed so that the gap between the tip region and the bottom pole layer in the portion comprising the partial insulating layer is larger than the gap in the portion comprising only the gap layer.

- Applicant asserts: the present invention provides a thin film magnetic head, which is capable of appropriately suppressing magnetic saturation and improving the electrical characteristics of a conventional head even with an increase in recording current (Specification, p. 1).

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
